

REFLECTION (STUDENT GRADE/ASSIGNMENT TRACKER)

What did I learn?

This project was a relearning experience for me more than a first-time one. I had done programming before but had stepped away from it for a while, so coming back into it meant re-familiarizing myself with things I had picked up previously and mostly forgotten, particularly object-oriented concepts like classes and inheritance. Building the Assignment/Homework/Exam class hierarchy and seeing `super()` actually work in practice helped bring a lot of it back. I also got more comfortable with Git as a workflow rather than just a submission step.

Challenges I faced

A power outage at home interrupted my work at one point and cost me some progress on the assignment, which set me back and meant redoing parts of it. On its own, my main recurring challenge was mixing up `if/elif` logic. A few times I accidentally wrote a new `if` instead of `elif`, which split what should have been one decision chain into two separate ones and caused branches to behave unpredictably. Debugging those taught me to read control flow more carefully rather than assuming the indentation alone was correct.

How I would improve it with more time

Be more careful with stuff, and practise more.
